

Quantum Field Theory C (Physics 215C)

Spring 2015

Lectures:

TTh 11:00-12:30 in Meyer Hall 5301.

Lecturer: John McGreevy

Mayer Hall 5222; email: mcgreevy at physics.ucsd.edu

Office Hours: Thursdays 2:30-3:55pm, or by appointment.

Use of the Web:

The course web page is

<http://physics.ucsd.edu/~mcgreevy/s15/>.

Problem sets, solutions, lecture notes, handouts, announcements, *etc* will be distributed via this page. You should check it regularly (*e.g.* before each lecture) for new material. It will help to look at the relevant lecture notes *before* the lecture happens.

Content:

Here's my opening bid: Theory of renormalization, effective field theory, effects of topology in QFT, anomalies, solitons and defects, lattice models of QFT, CFT in $d = 1 + 1$ and in $d > 1 + 1$. The choice of subject matter will evolve in response to the needs of the class membership.

Texts:

I do not plan to follow any textbook very closely. My posted lecture notes will be the main text. The textbook by Zee is wonderful and you should all keep it by your bedside. I will attempt to refer you to some relevant sections of the following books, most of which have been placed on reserve at S&E Library (or are available electronically):

Quantum Field Theory in a Nutshell, by Anthony Zee.

Quantum Field Theory of Many-Body Systems, by Xiao-Gang Wen.

Aspects of Symmetry, by Sidney Coleman.

Gauge Fields and Strings, by Alexander Polyakov.

Field Theories of Condensed Matter Systems, by Eduardo Fradkin.

The Physics of Quantum Fields, by Mike Stone.

Grading:

Grades will be determined by problem sets, class participation, and a brief final paper.

Problem sets:

Problem sets are a very important part of this course. Sitting down yourself and trying to reason your way through a problem not only helps you learn the material deeply, but also develops analytical tools fundamental to a successful career in science. I recognize that students also learn a great deal from talking to and working with each other. I encourage each student to make his/her own attempt on every problem and then, having done so, to discuss the problems with one another and collaborate on understanding them more fully. Such collaboration adds most to the understanding of those participants who have done the most by themselves first. The solutions you write up after any discussion and then submit must reflect your own work. They must not be transcriptions or reproductions of other people's work.

In doing the problems, you should feel free to use whatever computational software (*e.g.* *Mathematica*) you find useful; please make a note in your write-up when you do so.

Problem sets will be posted on the course web page

<http://physics.ucsd.edu/~mcgreevy/s15/hw.html> .

They will generally be due at the beginning of lecture on Tuesdays.

Miscellaneous unsolicited advice about how to do well in this class:

Come to lecture! I will post my lecture notes, but they are intended as a supplement to what is presented in lecture, not a substitute.

Keep up with the material. Review the lecture notes from previous lectures before the next one. The structure of this course is a bit of an experiment, and I am relying on all of you to follow its twists and turns. I will post the relevant reading assignments in advance; read ahead.

Start the homework problems as early as possible. Give yourself some time to think about them, and keep them in mind when you are reading and in lecture.

Ask lots of questions: in lecture, in office hours, in discussion section. The fact that you can ask questions is the point of having classes and not just having everyone go learn on their own.
