# Physics 215A QFT Fall 2021 Assignment 10

### Due 11:59pm Thursday, December 2, 2021

1. **Brain warmer.** Starting from the form of the generators in the vector (spin 1) representation,

$$(\mathbf{J}^i)_k^j = -\mathbf{i}\epsilon^{ijk} \tag{1}$$

(with  $\epsilon^{123}=1$ ) construct the matrix realizing a rotation by angle  $\theta$  about the z axis on a vector.

- 2. Lorentz algebra in D = 3 + 1.
  - (a) Check the algebra satisfied by rotations and boosts

$$[J^i, J^j] = \mathbf{i}\epsilon^{ijk}J^k, \quad [J^i, K^j] = \mathbf{i}\epsilon^{ijk}K^k, \quad [K^i, K^j] = -\mathbf{i}\epsilon^{ijk}J^k \tag{2}$$

using the explicit matrices in the vector representation given in lecture, namely

$$J^i = \begin{pmatrix} 0 \\ \mathbf{J}^i \end{pmatrix} \tag{3}$$

(where the  $3 \times 3$  matrix  $J^i$  is as in (1)) and

$$\left(K^{i}\right)^{j}{}_{0} = \mathbf{i}\delta^{i}_{j} = \left(K^{i}\right)^{0}{}_{j} \tag{4}$$

and all other components zero.

(b) Check that in terms of the antisymmetric tensor of operators

$$J^{\mu\nu} = \begin{cases} \epsilon^{ijk} J^k, & \mu\nu = ij \\ K^i, & \mu\nu = 0i \end{cases},$$

(4) can be rewritten as

$$[J^{\mu\nu}, J^{\rho\sigma}] = \mathbf{i} \left( \eta^{\nu\rho} J^{\mu\sigma} + \eta^{\mu\sigma} J^{\nu\rho} - (\mu \leftrightarrow \nu) \right), \tag{5}$$

which is the form of the so(d, 1) Lie algebra for general d.

(c) Show that in D = 3 + 1, (4) is equivalent to  $su(2)_L \times su(2)_R$ :

$$[J_{+}^{i}, J_{-}^{j}] = 0, \qquad [J_{\pm}^{i}, J_{\pm}^{j}] = \mathbf{i}\epsilon^{ijk}J_{\pm}^{k}$$

in terms of

$$J_{\pm}^{i} \equiv \frac{1}{2} (J^{i} \pm \mathbf{i} K^{i}).$$

### 3. A representation of the Clifford algebra gives a representation of Lorentz.

[Bonus problem] Show the following: Given a collection of  $k \times k$  matrices satisfying  $\{\gamma^{\mu}, \gamma^{\nu}\} = 2\eta^{\mu\nu}$  (the Clifford algebra, with  $\mu, \nu = 0..d$ ), we can make a k-dimensional representation of SO(1, d) with generators

$$J^{\mu\nu} = \frac{\mathbf{i}}{4} [\gamma^{\mu}, \gamma^{\nu}].$$

As an intermediate step, it is helpful to show that

$$[J^{\mu\nu},\gamma^{\rho}] \propto (\gamma^{\mu}\eta^{\nu\rho} - \gamma^{\nu}\eta^{\rho\mu}).$$

Convince yourself that this last equation says that  $\gamma^{\mu}$  transforms as a four-vector, *i.e.* 

$$[\gamma^{\mu}, J_{\rm Dirac}^{\mu\nu}] = (J_{\rm vector}^{\rho\sigma})^{\mu}{}_{\nu}\gamma^{\nu}.$$

The following problems are about discrete symmetries of scalar field theories. They are a useful warmup to the discussion of discrete symmetries of the Dirac fermion.

### 4. Brain warmer: $\mathbb{Z}_2$ symmetry of real scalar field theory.

What does the operator

$$U \equiv e^{\mathbf{i}\pi \sum_k \mathbf{a}_k^{\dagger} \mathbf{a}_k}$$

do to the real scalar field

$$\phi(x) \to \phi'(x) = U\phi(x)U^{\dagger}$$

whose ladder operators are  $\mathbf{a}, \mathbf{a}^{\dagger}$ ?

For which Lagrangians is this a symmetry?

## 5. Charge conjugation in complex scalar field theory.

Consider again a free complex Klein-Gordon field  $\Phi$ . Define a discrete symmetry operation (charge conjugation) C, by

$$\Phi(x) \mapsto C\Phi(x)C^{-1} = \eta_c \Phi^{\dagger}(x)$$

where C is a unitary operator, and  $\eta_c$  is an arbitrary phase factor. Assume that the vacuum is invariant under charge conjugation:  $C|0\rangle = |0\rangle$ .

(a) Show that the free lagrangian is invariant under C, but the particle number current  $j^{\mu}$  changes sign.

(b) Show that the annihilation operators satisfy

$$C\mathbf{a}_k C^{-1} = \eta_c \mathbf{b}_k, \quad C\mathbf{b}_k C^{-1} = \eta_c^* \mathbf{a}_k$$

and hence show that C interchanges particle and antiparticle states, up to a phase.

6. Parity symmetry of scalar field theory.

Under the parity transformation

$$\vec{x} \mapsto \vec{x}' = -\vec{x}$$

a real Klein-Gordon transforms as

$$\phi(t, \vec{x}) \mapsto P\phi(t, x)P^{-1} = \eta_p \phi(t, -\vec{x}) \tag{6}$$

where P is unitary and  $\eta_P = \pm 1$  is the *intrinsic parity* of the field  $\phi$ . Again assume  $P|0\rangle = |0\rangle$ .

- (a) Show that the parity transformation preserves the free Lagrangian (though not the Lagrangian density), for both values of  $\eta_P$ .
- (b) Show that an arbitrary n-particle state transforms as

$$P\left|\vec{k}_{1},\cdots\vec{k}_{n}\right\rangle = \eta_{P}^{n}\left|-\vec{k}_{1},\cdots,-\vec{k}_{n}\right\rangle.$$

(c) Here we give an explicit realization of the parity operator. Let

$$P_1 \equiv e^{-\mathbf{i}\frac{\pi}{2}\sum_k \mathbf{a}_k^{\dagger} \mathbf{a}_k}, \quad P_2 \equiv e^{\mathbf{i}\eta_p \frac{\pi}{2}\sum_k \mathbf{a}_k^{\dagger} \mathbf{a}_{-k}}.$$

Show that

$$P_1 \mathbf{a}_k P_1^{-1} = -\mathbf{i} \mathbf{a}_k, \quad P_2 \mathbf{a}_k P_2^{-1} = +\mathbf{i} \eta_p \mathbf{a}_{-k}.$$

Hint: Use the following version of the Campbell-Baker-Hausdorff formula

$$e^{\mathbf{i}\alpha A}Be^{-\mathbf{i}\alpha A} = \sum_{n=0}^{\infty} \frac{(\mathbf{i}\alpha)^n}{n!} B_n$$

where  $B_0 \equiv B$  and  $B_n = [A, B_{n-1}]$  for n = 1, 2, ...

Show that  $P \equiv P_1 P_2$  is unitary, and satisfies (8).

(d) Action on the current of a complex scalar field. Consider now a complex scalar field. Using the results from problems 5 and the preceding parts of 6, find the action of parity on the particle current  $j^{\mu} \mapsto Pj^{\mu}P^{-1}$ . (You'll have to extend the action of P from the case of a real field to the complex case.)
